Ī	3 Arch (BxD)	1390x970mm	1150x820mm	1030x740mm	1030x740mm
Ī	Required Opening for bridges is calculated as per the Crown Land Bridge Management Guidelines.				

Conditions on Culvert Design Options

Shaded Area for ARFMI Road

· Initial Fisheries Review based on one pipe. Two or more pipes requires a re-assessment.

- · All calculations are for projecting ends. Total pipe length normally not to exceed 20m. All calculations assume a Headwater Depth of 1.0. MP = Multi-Plate (i.e. SPCSP) Standards for Single, Small Closed-Bottom Round Culverts • This standard applies to single, round, corrugated, closed-bottom steel, aluminum, or plastic culverts less than or equal to 1200mm in diameter that do not require site-specific engineering approval per MNRF's Crown Land Bridge Manual. • This standard only applies if the project does not: - Replace an existing open-bottom crossing (e.g., clear span bridge, arch culvert); prevent release of sediment or other deleterious substances into watercourse. Replace an existing closed-bottom culvert larger in diameter than that being installed; or Involve the installation of more than one closed-bottom culvert at the crossing location. • Locate, design and construct to minimize likelihood of ongoing outlet scour, culvert undermining or erosion of fill in order to provide stable, non-perched culverts that provide for fish passage • Do not locate on meander bends, braided streams, or any other area inherently unstable that may result in alteration of natural stream functions or erosion and scouring of the structure. Size to a minimum Q25 design flow. If an unmapped stream is encountered and proper analysis cannot be with the exception of potential and temporary blockage due to water crossing construction/decommissioning activities. completed to determine Q25, size to ensure it spans from bank to bank. • Do not install where channel slope at crossing location is of a gradient greater than 2.0%. Where fishery communities are not well documented, the most restrictive in-water timing window must be used. Do not install where slope of road approaches or either bank approach is greater than 30% (17°). • Locate where culvert can be embedded below grade of stream bed. Use site-specific mitigation measures to ensure no ongoing erosion of fill. As a minimum: - Stabilize both inlet and outlet ends with appropriately sized non-erodible material; - Rock used is clean, free of fine materials and of sufficient size to resist peak flood events; Place rock at original bank grade to ensure no infilling or narrowing of watercourse; Store fuel and other materials for machinery a minimum of 30m from the watercourse. - Fill material placed below normal high water mark must be erosion resistant and/or protected from erosion. The Forest Management Guide for Conserving Biodiversity at the Stand and Site Scales refers to the normal high-water disturbance to the banks of the watercourse and adjacent riparian vegetation areas. mark as the edge of vegetation communities capable of providing an effective barrier to the movement of sediment. • Do not locate within 100 metres of fisheries spawning or sensitive habitat. • Do not locate within 500 metres of any brook trout spawning or upwelling areas. implementating the project, and only if using an existing crossing at another location is not available or practical. If minor rutting is likely, watercourse bank and bed protection methods (e.g., swamp mats, pads) are to • Do not locate on watercourses that flow into, and are within 500m of, known naturally reproducing brook trout lakes. • Mix of size, length, slope & drainage area must not increase flows to consistently & predictably impede fish passage. be used provided they do not constrict flows or block fish passage; • Install under low-flow conditions and not when flows are elevated due to local rain events or seasonal flooding. · Grading of the watercourse banks for the approaches is not permitted; • Both interior and exterior of culverts must be corrugated to ensure structural stability and facilitate fish passage • If the watercourse bed and banks are steep and highly erodible (e.g., dominated by organic materials and silts) • The grade of the culvert must reflect the grade of the natural watercourse bed. and erosion or degradation is likely, use a temporary crossing structure or other practice to protect them; • Compact backfill adequately around the culvert. Use only dean sand or gravel and compact around the culvert in layers. . The one-time fording must adhere to the appropriate in-water timing windows; Fording must occur under low-flow • Length of culverts must permit banks to be sloped at an angle of 2:1 or a stable angle of repose for the materials used. conditions and not when flows are elevated due to local rain events or seasonal flooding
- Round culvert calculations assume 10% fill. For 20% fill, increase diameter to next highest standard diameter. · For 40% fill, use a round culvert diameter of the Base distance of the corresponding Arch style culvert **General Standards** · Install erosion and sediment control measures prior to commencement of construction or decommissioning to • Fill material placed below the normal high water mark must be erosion-resistant and/or protected from erosion. • Direct storm water runoff from bridge decks, side slopes, road approaches and ditches away from the watercourse • Abide by fisheries in-water timing windows in the approved FMP and/or forest management guides. · Complete all in-water construction and decommissioning activities in an uninterrupted fashion and in an appropriate Maintain machinery free of fluid and fuel leaks. Wash, refuel and service machinery at least 30m from watercourse. · Operate machinery on land with tracks/wheels above the normal high water mark, or on ice in a manner that avoids · Remove all debris from construction and decommissioning work from the site following completion of the undertaking. · If machinery fording is required, limit to a one-time event (over and back) per piece of equipment essential to

- No watercourse realignment, nor use of explosives is permitted.
 Minimize loss or disturbance to riparian vegetation. Restrict removal of riparian vegetation to the disturbance footprint required for construction, maintenance and decommissioning of the water crossing. and into a retention pond or vegetated area.
 Ensure erosion and siltation in ditch lines adjacent to the watercourse crossing approaches are controlled using sediment traps such as rock/soil dams or log jams as site conditions warrant. • Do not block or impede the free passage of water and fish at any time of year up and down stream, If installation requires inwater work, do not locate within 100m of spawning or sensitive fish habitat eg. rapids, riffles, known overwintering areas.

Reviewed by MNRF. Follow standard(s) as well as any Appendix 2 conditions.

MNRF Appendix 2: Biologist Risk Evaluation Concerns and Conditions on Construction

- Wide flood plain. Ensure culvert is placed in line with watercourse.
- -FRMG Note: Existing crossing site
