	Required Oper	ning for bridges is calculate	ed as per the Crown Land	Bridge Management Guide	elines.

## **Conditions on Culvert Design Options**

Shaded Area for ARFMI Road

Office Use Only Network No.

· Initial Fisheries Review based on one pipe. Two or more pipes requires a re-assessment. Round culvert calculations assume 10% fill. For 20% fill, increase diameter to next highest stand . For 40% fill, use a round culvert diameter of the Base distance of the corresponding Arch style cu

## **General Standards**

- No watercourse realignment, nor use of explosives is permitted.
   Minimize loss or disturbance to riparian vegetation. Restrict removal of riparian vegetation to the disturb footprint required for construction, maintenance and decommissioning of the water crossing. · Install erosion and sediment control measures prior to commencement of construction or decommission
- prevent release of sediment or other deleterious substances into watercourse.
- · Fill material placed below the normal high water mark must be erosion-resistant and/or protected from • Direct storm water runoff from bridge decks, side slopes, road approaches and ditches away from the
- Direct storm water to not indege decays, side stopes, road approaches and others away non-interval and into a retention pond or vegetated area.
  Ensure erosion and siltation in ditch lines adjacent to the watercourse crossing approaches are controlle sediment traps such as rock/soil dams or log jams as site conditions warrant.
  Do not block or impede the free passage of water and fish at any time of year up and down stream, the processing approaches area.
- with the exception of potential and temporary blockage due to water crossing construction/decommiss • Abide by fisheries in-water timing windows in the approved FMP and/or forest management guides.
- Where fishery communities are not well documented, the most restrictive in-water timing window mus · Complete all in-water construction and decommissioning activities in an uninterrupted fashion and in ar
- If installation requires inwater work, do not locate within 100m of spawning or sensitive fish habitat eg. rapids, riffles, known overwintering areas.
- Maintain machinery free of fluid and fuel leaks. Wash, refuel and service machinery at least 30m from Store fuel and other materials for machinery a minimum of 30m from the watercourse.
- · Operate machinery on land with tracks/wheels above the normal high water mark, or on ice in a manne disturbance to the banks of the watercourse and adjacent riparian vegetation areas.
- · Remove all debris from construction and decommissioning work from the site following completion of the
- · If machinery fording is required, limit to a one-time event (over and back) per piece of equipment essen implementating the project, and only if using an existing crossing at another location is not available or If minor rutting is likely, watercourse bank and bed protection methods (e.g., swamp mats, pads) are
- be used provided they do not constrict flows or block fish passage; · Grading of the watercourse banks for the approaches is not permitted;
- · If the watercourse bed and banks are steep and highly erodible (e.g., dominated by organic materials
- and erosion or degradation is likely, use a temporary crossing structure or other practice to protect th
- . The one-time fording must adhere to the appropriate in-water timing windows; Fording must occur ur conditions and not when flows are elevated due to local rain events or seasonal flooding.

## Self-assessed. Follow conditions of appropriate standard(s).

MNRF Appendix 2: Biologist Risk Evaluation Concerns and Conditions on Construction

The crossing is proposed at a previously approved and existing crossing site. Installation is suggested at this site rather than creating new approaches, abutments, landings, etc. This ranking does not authorize any undertaking that results in serious harm to fish, but suggests a low risk of causing serious harm to fish in compliance with the Fisheries Act following best practices such as those described in the DFO measures to avoid causing harm to fish and fish habitat and the standard mitigation techniques outlined in the FMP — Culvert replacement; use existing crossing location.
