

Abitibi River Forest Appendix 1: Form for Submission of Information on a Proposed Crossing

Shaded Area for Office Use Only	ARFMI Road Network No. 0	Distance Along Road Segment	Crossing Evaluation Reference Number 5607
---------------------------------	---------------------------------	-----------------------------	--

Publication Date: February 19, 2020

Abitibi River Forest - S.F.L. # 551832	Fisheries Operational Management Zone (OMZ):
Proponent: 3 Nations Logging LP c/o P.O. Box 867 New Liskeard, Ontario P0J 1P0 (705) 680-0033	Standard for Self-assessed Water Crossing Construction, Removal and/or Decommissioning: Conditions of standard not met for first structure. See red text.
Plan Term: 2012-2022	Previous Assessment Year (incl. SA): 2020
AWS Year: 2020-21	SAR species likely to be impacted: NO
	Preconstruction photos available: NO
	Within 500m of Brook Trout stream: YES

Culvert Design Options	Q ₂₅	Q ₁₀	Q ₅	Q _{2.33}
Design Flow	0.000 m ³ /sec	0.000 m ³ /sec	0.000 m ³ /sec	0.000 m ³ /sec
1 Round	450mm	450mm	450mm	450mm
2 Round	N/A	N/A	N/A	N/A
3 Round	N/A	N/A	N/A	N/A
1 Arch (BxD)	450x340mm	450x340mm	450x340mm	450x340mm
2 Arch (BxD)	N/A	N/A	N/A	-
3 Arch (BxD)	N/A	N/A	N/A	-

• Required Opening for bridges is calculated as per the Crown Land Bridge Management Guidelines.

Conditions on Culvert Design Options

- Initial Fisheries Review based on one pipe. Two or more pipes requires a re-assessment.
- Round culvert calculations assume 10% fill. For 20% fill, increase diameter to next highest standard diameter.
- For 40% fill, use a round culvert diameter of the Base distance of the corresponding Arch style culvert.

General Standards

- No watercourse realignment, nor use of explosives is permitted.
- Minimize loss or disturbance to riparian vegetation. Restrict removal of riparian vegetation to the disturbance footprint required for construction, maintenance and decommissioning of the water crossing.
- Install erosion and sediment control measures prior to commencement of construction or decommissioning to prevent release of sediment or other deleterious substances into watercourse.
- Fill material placed below the normal high water mark must be erosion-resistant and/or protected from erosion.
- Direct storm water runoff from bridge decks, side slopes, road approaches and ditches away from the watercourse and into a retention pond or vegetated area.
- Ensure erosion and siltation in ditch lines adjacent to the watercourse crossing approaches are controlled using sediment traps such as rock/soil dams or log jams as site conditions warrant.
- Do not block or impede the free passage of water and fish at any time of year up and down stream, with the exception of potential and temporary blockage due to water crossing construction/decommissioning activities.
- Abide by fisheries in-water timing windows in the approved FMP and/or forest management guides. Where fishery communities are not well documented, the most restrictive in-water timing window must be used.
- Complete all in-water construction and decommissioning activities in an uninterrupted fashion and in an appropriate timeframe to minimize potential for site disturbance.
- If installation requires in-water work, do not locate within 100m of spawning or sensitive fish habitat eg. rapids, riffles, known overwintering areas.
- Maintain machinery free of fluid and fuel leaks. Wash, refuel and service machinery at least 30m from watercourse. Store fuel and other materials for machinery a minimum of 30m from the watercourse.
- Operate machinery on land with tracks/wheels above the normal high water mark, or on ice in a manner that avoids disturbance to the banks of the watercourse and adjacent riparian vegetation areas.
- Remove all debris from construction and decommissioning work from the site following completion of the undertaking.
- If machinery fording is required, limit to a one-time event (over and back) per piece of equipment essential to implementing the project, and only if using an existing crossing at another location is not available or practical.
 - If minor rutting is likely, watercourse bank and bed protection methods (e.g., swamp mats, pads) are to be used provided they do not constrict flows or block fish passage;
 - Grading of the watercourse banks for the approaches is not permitted;
 - If the watercourse bed and banks are steep and highly erodible (e.g., dominated by organic materials and silts) and erosion or degradation is likely, use a temporary crossing structure or other practice to protect them;
 - The one-time fording must adhere to the appropriate in-water timing windows; Forging must occur under low-flow conditions and not when flows are elevated due to local rain events or seasonal flooding.

- All calculations are for projecting ends. Total pipe length normally not to exceed 20m.
- All calculations assume a Headwater Depth of 1.0.
- MP = Multi-Plate (i.e. SPCSP)

Standards for Single, Small Closed-Bottom Round Culverts

- This standard applies to single, round, corrugated, closed-bottom steel, aluminum, or plastic culverts less than or equal to 1200mm in diameter that do not require site-specific engineering approval per MNR's Crown Land Bridge Manual.
- This standard only applies if the project does not:
 - Replace an existing open-bottom crossing (e.g., clear span bridge, arch culvert);
 - Replace an existing closed-bottom culvert larger in diameter than that being installed; or
 - Involve the installation of more than one closed-bottom culvert at the crossing location.
- Locate, design and construct to minimize likelihood of ongoing outlet scour, culvert undermining or erosion of fill in order to provide stable, non-perched culverts that provide for fish passage.
- Do not locate on meander bends, braided streams, or any other area inherently unstable that may result in alteration of natural stream functions or erosion and scouring of the structure.
- Size to a minimum Q₂₅ design flow. If an unmapped stream is encountered and proper analysis cannot be completed to determine Q₂₅, size to ensure it spans from bank to bank.
- Do not install where channel slope at crossing location is of a gradient greater than 2.0%.
- Do not install where slope of road approaches or either bank approach is greater than 30% (17°).
- Locate where culvert can be embedded below grade of stream bed.
- Use site-specific mitigation measures to ensure no ongoing erosion of fill. As a minimum:
 - Stabilize both inlet and outlet ends with appropriately sized non-erodible material;
 - Rock used is clean, free of fine materials and of sufficient size to resist peak flood events;
 - Place rock at original bank grade to ensure no infilling or narrowing of watercourse;
 - Fill material placed below normal high water mark must be erosion resistant and/or protected from erosion.
 The Forest Management Guide for Conserving Biodiversity at the Stand and Site Scales refers to the normal high-water mark as the edge of vegetation communities capable of providing an effective barrier to the movement of sediment.
- Do not locate within 100 metres of fisheries spawning or sensitive habitat.
- Do not locate within 500 metres of any brook trout spawning or upwelling areas.
- Do not locate on watercourses that flow into, and are within 500m of, known naturally reproducing brook trout lakes.
- Mix of size, length, slope & drainage area must not increase flows to consistently & predictably impede fish passage.
- Install under low-flow conditions and not when flows are elevated due to local rain events or seasonal flooding.
- Both interior and exterior of culverts must be corrugated to ensure structural stability and facilitate fish passage.
- The grade of the culvert must reflect the grade of the natural watercourse bed.
- Compact backfill adequately around the culvert. Use only clean sand or gravel and compact around the culvert in layers.
- Length of culverts must permit banks to be sloped at an angle of 2:1 or a stable angle of repose for the materials used.

Reviewed by MNR. Follow standard(s) as well as any Appendix 2 conditions.

MNR Appendix 2: Biologist Risk Evaluation

Watershed Thermal Code : CD MNR Assigned Thermal Code at Crossing **CD**

Concerns and Conditions on Construction	Structure 1	Structure 2	Structure 3
Structure 1: This is a culvert with low risk that assumes operators follow standards and guidelines. This ranking does not authorize any undertaking that results in serious harm to fish that are part of a commercial, recreational or Aboriginal fishery, but suggests there is a low risk of causing serious harm to fish in compliance with the Fisheries Act following best practices such as those described in the DFO measures to avoid causing harm to fish and fish habitat and the standard mitigation techniques outlined in the FMP.			
Structures 2,3: The crossing is a portable bridge spanning the high water mark and/or a winter crossing; no in-water work is proposed and is low risk following standards and guidelines. This ranking does not authorize any undertaking that results in serious harm to fish, but suggests a low risk of causing serious harm to fish in compliance with the Fisheries Act following best practices such as those described in the DFO measures to avoid causing harm to fish and fish habitat and the standard mitigation techniques outlined in the FMP.			
Risk Evaluation:	LOW	LOW	LOW
